

# ***WeRateDogs Tweets Archive – Analysis Report***

***By Haitham M. Adham***

***January 2021***

## **Introduction**

WeRateDogs is a Twitter account that rates people's dogs with a humorous comment about the dog. These ratings almost always have a denominator of 10. The numerators, though? Almost always greater than 10. 11/10, 12/10, 13/10, etc. Why? Because "they're good dogs Brent." WeRateDogs has over 4 million followers and has received international media coverage.

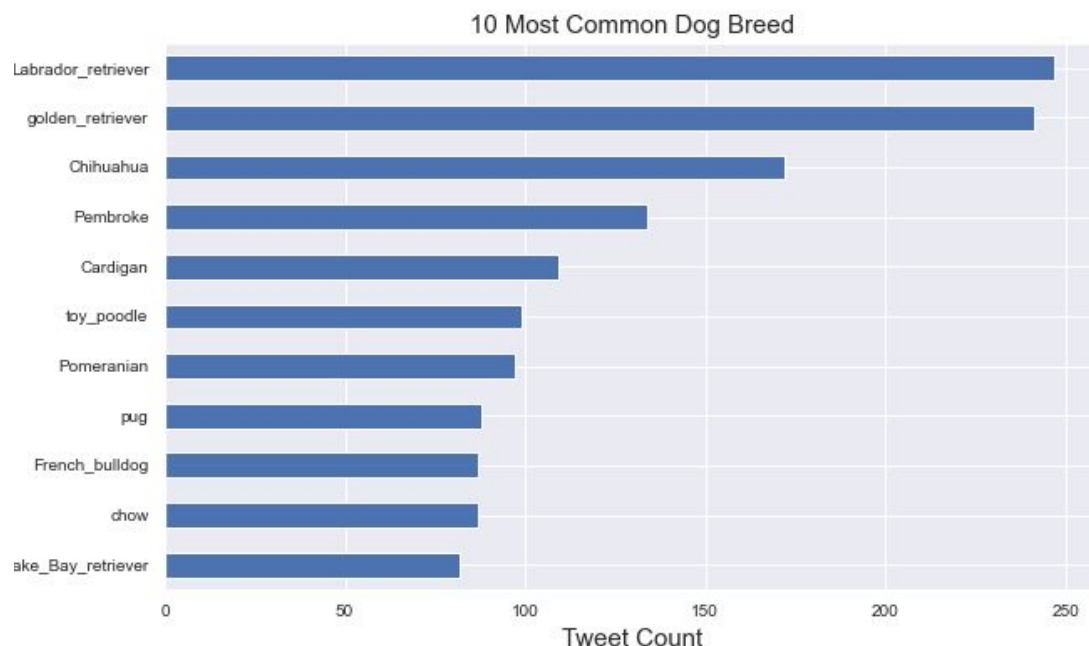

This report summarises the insights with visualisation of the analysis performed on the twitter archive for all their tweets as they stood on August 1, 2017.

## **Analysis**

My analysis focuses on the interactions with different dog stages and shows how the results differ between when analysing those interactions as overall counts and using statistical calculations like mean.

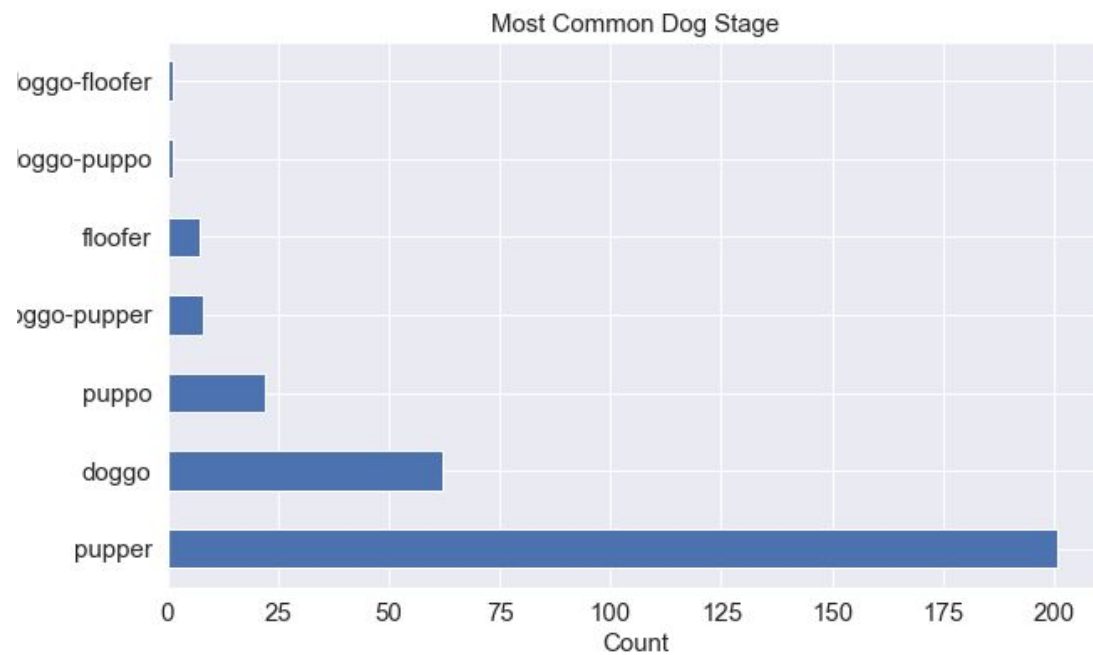

Lets see...

1. Most Common Dog breed in all tweets.

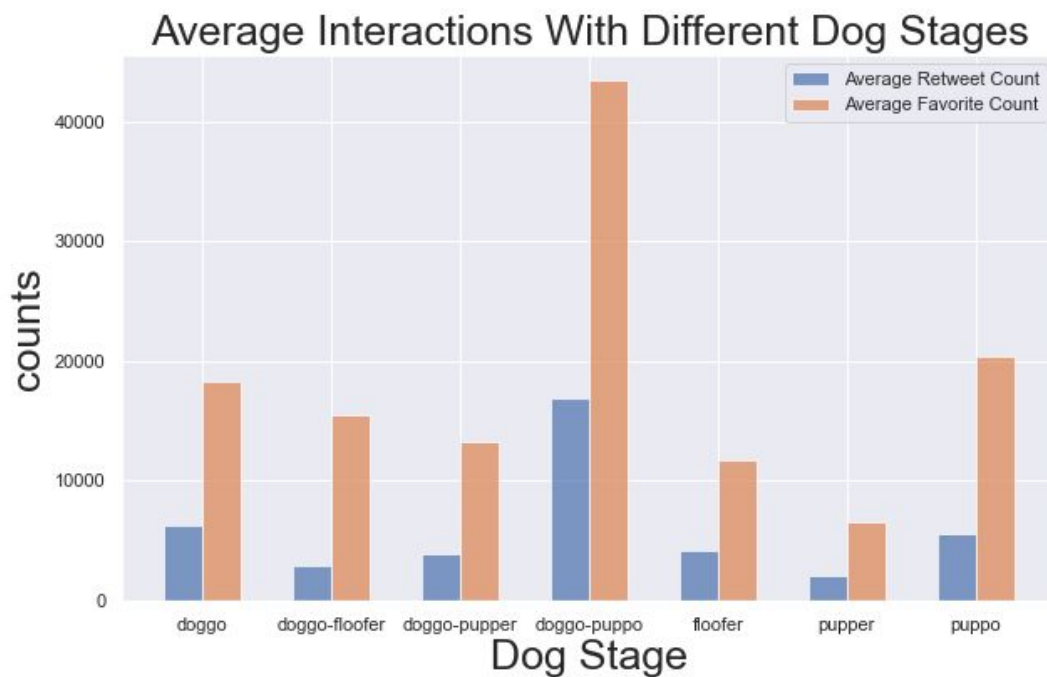

As we can see here most of the tweets were about those two common breeds here which are 'Labrador\_retriever' and 'Golden\_retriever' with a slight difference between them.

## 2. Most Common Dog Stage in all tweets.

As we can see here, most dog stages in those tweets were 'Pupper'.

### 3. Average Interactions With Different Dog Stages.

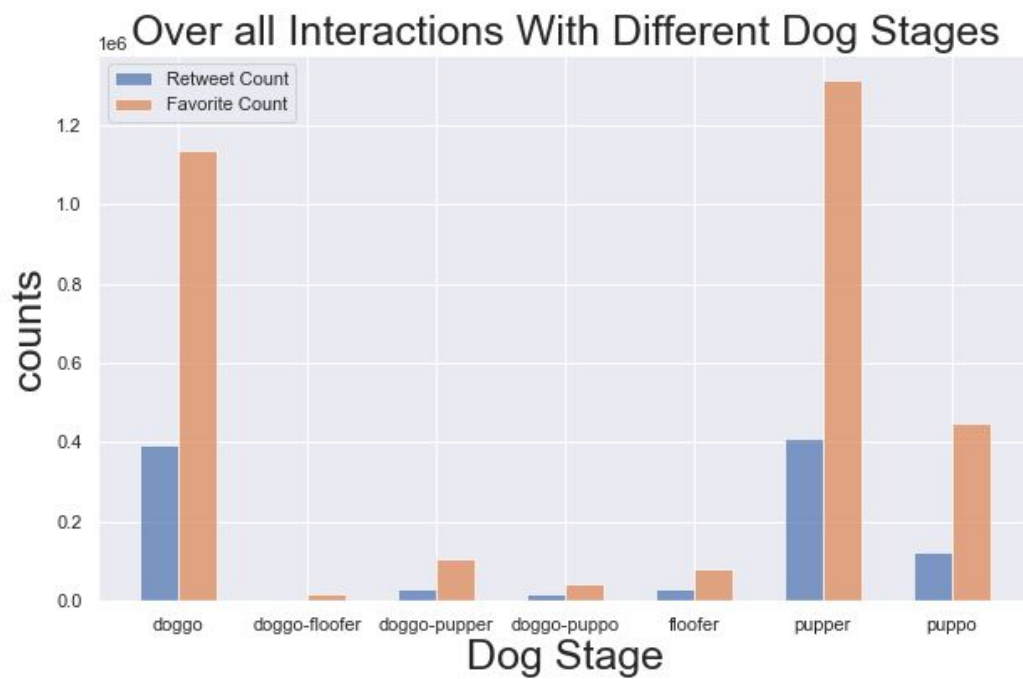

Here after calculating the mean of the interaction of people with different dog stages we can see that most retweets and counts about those two stages 'Doggo' and 'Puppo'.

However knowing that the most dog stage is 'Pupper' i was expecting that most interactions gonna be on 'pupper' but apparently after calculating the average of the interactions it turns out it differs from the overall count which makes the average more descriptive and accurate result.

Lets see the overall count of interactions.

#### 4. Over all Interactions With Different Dog Stages.

As we can see here the result of the overall count of interactions differs a lot from the average count of interactions.
